

Plan: Implement `/contracts`, `/notifications`, `/verification` (+ `/verification-center`) + Buying House product posting + Product view history

Summary

Deliver the next 4 pages with “buyer-asked” functionality and a consistent LinkedIn-style UI:

- `/contracts` : full contract vault workflow (draft → signatures → PDF artifact → archive) + secure record/audit UX
 - `/notifications` : smart search-match notifications + search-alert management + **Viewed Products history**
 - `/verification` + `/verification-center` : verification-doc upload UI aligned **exactly** with backend role/region requirements + credibility messaging
- Additionally:
- Ensure **Buying House can post/manage products** in UI (already allowed in backend)
 - Add **product view tracking** (counts when user opens “Quick View”), shown both in `/search` sidebar and `/notifications` as a tab
-

Key Changes (Frontend)

1) `/verification` and `/verification-center` (same component)

- Replace the current UI's `DOCUMENT_MATRIX` (it does not match buyer's required docs) with the backend verification rules from `server/services/verificationService.js`.
- UI sections:
 - **Header**: “Verification is subscription-based and renews monthly” + Help Center link
 - **Role/Region context**
 - Buyer: select `buyer_country` (EU auto-detected; USA inferred; else OTHER)
 - Factory/Buying House: no region switch
 - **Mandatory documents checklist** (keys must match backend):
 - Factory (6): `company_registration`, `trade_license`, `tin`, `authorized_person_nid`, `bank_proof`, `erc`

- Buying House (5): `company_registration`, `trade_license`, `tin`, `authorized_person_nid`, `bank_proof`
- Buyer:
 - EU: `company_registration`, `vat`, `eori`, `bank_proof`
 - USA: `company_registration`, `ein`, `ior`, `bank_proof`
 - OTHER: `company_registration`, `bank_proof`
- **Optional licenses:** add/edit list → stored in `documents.optional_licenses[]`
- **Credibility panel:** show `credibility.score`, `credibility.badge`, and the professional trust message (“more licensing proof increases credibility...”)
- Upload flow:
 - Keep upload via `POST /documents` (`entity_type= verification`, `type= <doc_key>`)
 - After upload success, patch verification via `POST /verification/me` with `{ documents: { [doc_key]: <truthy value> } }`
 - Do **not** show document IDs/numbers publicly; only ✓ / missing in profiles (already done).

2) `/contracts` (Contract Vault)

- Keep the existing step logic, but update the UX to match the new blue/white design:
 - Left: contract list with status chips + search box + quick filters (Draft / Pending / Signed / Archived)
 - Right: contract detail panel with:
 - Flow tracker (Draft → Buyer sign → Factory sign → PDF generated → Lock → Archive)
 - “Download PDF” only when generated
 - Artifact audit block (hash, version, timestamps)
- Add “secure banking info” UX without processing payments:
 - Extend contract draft form to include optional **banking reference fields** (e.g., `transaction_reference`, `bank_name`, `beneficiary_name`) stored on the contract record.
 - Display these fields **masked** by default; show full values only to contract participants or admin/owner.
- Keep digital signature as “confirm step” buttons (as your MVP does), and store signed timestamps already supported.

3) `/notifications` (Smart alerts + Viewed products)

- Convert to tabbed notification center:
 - Tabs: All / Search Matches / System / Conversation Locks / Rating Requests / **Viewed Products**
- Search alerts management:

- Add a “Saved Alerts” panel listing `GET /notifications/search-alerts`
- Add delete action (requires new backend endpoint) so users can remove alerts.
- “Viewed Products” tab:
 - List paginated recently viewed items (from new backend view-history endpoint)
 - Each row shows product title, company name, viewed time, and quick actions: View company profile / Quick view again.

4) /search enhancement (for the “Both” choice)

- Add a compact right-side panel “Recently viewed”:
 - Shows last ~5 viewed products (same history source as `/notifications`)
 - Clicking one opens the **Quick View modal** and records another view.

5) Buying House product posting (UI)

- Update navigation and UX so buying houses can actually use the already-enabled backend:
 - Add “Products” / “Product Management” link in Buying House navbar.
 - Upgrade `/product-management` from static list to real CRUD:
 - List: `GET /products` filtered to current org
 - Create: `POST /products` (already supports buying_house)
 - Edit/Delete: add endpoints if missing (or implement soft-delete in json store)
 - Ensure buying house products appear on:
 - `/feed` mixed feed
 - `/buying-house/:id` Products tab (already in the profile plan)

Key Changes (Backend APIs)

1) Product view tracking (new)

- Add `POST /products/:productId/view` (auth required)
 - Called only when user opens **Quick View** (per your choice)
 - Writes to `product_views.json` (dedupe per user+product within a short window, e.g., 10 minutes)
 - Also call `trackEvent({ type: 'product_viewed', actor_id, entity_id: productId })` for analytics.
- Add `GET /products/views/me?cursor&limit` (auth required)
 - Returns paginated view history enriched with:
 - product fields (title/category/moq/lead time/video badge)

- company author info (id/name/role/verified/country)
- `viewed_at`
- (Optional) Add `GET /products/views/summary` later for enterprise analytics.

2) Search alert delete (new)

- Add `DELETE /notifications/search-alerts/:alertId` (auth required)
 - Removes the alert from `search_alerts.json`

3) Contract banking reference fields (extend existing)

- Extend contract draft schema stored in `documents.json` (entity_type= `contract`) to include optional banking reference fields.
- Ensure `listContracts` scopes as it already does; enforce masking rules server-side if you prefer.

4) Verification UI alignment (no new verification rules)

- Keep backend verification rules as source of truth (`verificationService.js`).
 - Only adjust frontend keys to match backend keys (no policy change).
-

UX Detail: Quick View modal (shared component)

- Add a reusable “Quick View” modal for product cards (Search, Profile, Recently Viewed list):
 - Shows product info + company mini-card + video link badge
 - On open: call `POST /products/:id/view`
 - Primary CTA: “Contact” → `/chat` notice
 - Secondary CTA: “View company profile”
-

Test Plan (manual acceptance)

1. Verification
 - Buyer EU/USA/OTHER toggles required checklist correctly based on country.
 - Uploading each required doc changes checklist from Missing → ✓ and updates credibility score.
2. Notifications

- Smart search-match notifications appear after creating a product that matches a saved alert.
- Search alerts list loads and delete works.
- Viewed Products tab shows items after opening Quick View in search/profile.

3. Product views

- Opening Quick View records exactly one view (deduped in short window).
- Recently viewed appears on `/search` sidebar and `/notifications` tab.

4. Buying House products

- Buying house can access product management from navbar and create products.
- Created products appear in feed and on buying house profile products tab.

5. Contracts

- Draft creation, signatures, PDF generation, locking, and download work.
- Banking reference fields save and display masked for non-participants.

Assumptions / Defaults

- “Viewed product” is recorded **only on Quick View open**, not on impressions or simple scroll.
- Viewed history is **private to the user** (not exposed publicly to companies).
- `/verification` and `/verification-center` remain the same component/route behavior, just upgraded UI and doc keys.
- Buying house product posting is enabled in UI because backend already allows `buying_house` on `POST /products`.
