

Plan: Implement `/search` + Profile Pages

(`/buyer/:id`, `/factory/:id`, `/buying-house/:id`)

Summary

Upgrade `/search` and the three profile pages into fully dynamic, LinkedIn-style (blue/white) B2B screens with:

- Smart notifications (“watch this search” alerts)
 - Clean + subscription-gated advanced filters
 - Verified badge + **public verification checklist** (license names + ✓ / missing) and a credibility score (no sensitive IDs/files)
 - Profile tabs (Overview / Products / Buyer Requests / Video Gallery / Reviews / Partner Network where applicable)
 - Working “Contact” → opens `/chat` respecting the existing message-request hierarchy
-

Key Changes (Frontend)

1) `/search` page (replace current mocky behavior with production behavior)

- **UI structure**
 - Top: query bar + Search button + “Save alert” (watch) button
 - Result-type tabs (icons + counts): All / Buyer Requests / Companies
 - Filters:
 - **Free/basic:** `q`, `category`
 - **Premium/advanced (locked UI when free):** MOQ range, country, verified only, org type (Buyer/Factory/Buying House), lead-time window
 - Show clear quota/upgrade messaging using backend responses (`code` , `quota` , `capabilities`).
- **Smart notifications (per your answer: “Tap to save” recommended)**
 - “Save alert” calls `POST /search/alerts` (or unify to `POST /notifications/search-alerts` , pick one and use it consistently).

- After saving: show success + remaining quota; optionally show “Manage alerts” link → `/notifications`.

- **Result cards**

- Buyer Request cards:
 - Show structured fields (Category, Quantity/MOQ, Timeline, Material, Shipping terms, Notes snippet).
 - CTA: “Open profile” + “Contact” (goes to `/chat`).
- Company cards:
 - Show name, role, country, key capabilities (capacity/MOQ/lead time if available), video badge, rating summary.
 - CTA: “View profile” + “Contact”.

- **Ratings on search**

- Use stable rating key: `profile_key = user:<author.id>` for all result cards.
- Fetch in batch via `GET /ratings/search?profile_keys=user:id1,user:id2,...` and render average + confidence.

2) Profile pages (Buyer / Factory / Buying House)

All three pages share a common shell:

- **Header card**

- Name, role label, country/city, verified badge (blue tick + “Verified”).
- Primary CTA: **Contact** → navigates to `/chat` with a notice (unverified → request pool).
- Secondary CTAs: Follow / Connect (optional, uses existing `/users/:id/follow` and `/users/:id/friend-request`).

- **Verification & credibility panel (public-safe)**

- Show:
 - “Verification status: Verified / Not verified”
 - “Credibility: (/100)”
 - Checklist of required licenses (names) with ✓/Missing (no document numbers, no uploaded file links).
 - For buyers: show region logic (EU/USA/OTHER) and required docs accordingly.
 - A professional line: “More licensing proof increases credibility and international trust.”

- **Tabs by role**

- Buyer:
 - Overview (about, tags, typical order volume, preferred fabrics, certifications)
 - Buyer Requests (list + open/closed badges; paginated)
 - Reviews (existing ratings summary + list)
- Factory:
 - Overview (capacity, MOQ, lead time, certifications, markets/export)
 - Products (paginated)

- Video Gallery (only approved media public; pending/restricted hidden unless self/admin)
 - Reviews
 - Buying House:
 - Overview (years, services, markets, rating)
 - Partner Network (public: count only + “Request partner” CTA if factory/buying house; private view shows list if self/admin)
 - Active Handling (optional placeholder until real data exists)
 - Reviews / Metrics (from ratings + simple computed stats)
-

Key Changes (Backend APIs + Data)

1) Fix and enrich search results so the UI can be real

Update both search endpoints to return author info and real “verifiedOnly” behavior:

- `GET /requirements/search`
 - Current bug: `verifiedOnly` checks `r.verified` (doesn't exist). Fix by joining buyer user record.
 - Response item shape becomes:
 - requirement fields + `author: { id, name, role, verified, country }`
 - `profile_key: user:<author.id>`
- `GET /products/search`
 - Join company user record and include:
 - `author: { id, name, role, verified, country }`
 - `profile_key: user:<author.id>`
 - Implement advanced filters used by UI where feasible:
 - `country` filter via `author.profile.country`
 - `verifiedOnly` via `author.verified`
 - `moqRange` via `product.moq` numeric parsing
 - `orgType` via `author.role`

2) Add profile data endpoints (so `/buyer/:id` etc aren't hardcoded)

Add new routes (auth required; return “safe” data only):

- `GET /profiles/:userId`
 - Returns:

- `user: { id, name, role, verified, subscription_status, created_at, profile:{country, certifications, monthly_capacity, moq, lead_time_days} }` (exclude `bank_proof/export_license` raw strings from public response)
- `verification_summary: { verified, buyer_region, credibility, required_checklist:[{key,label,submitted:boolean}], optional_licenses_count }`
- `rating_key: user:<id>`
- `relationship: { following, friend_status }` for current viewer
- `counts: { products, requests, connected_factories }`
(`connected_factories` may be null if viewer not allowed)
- `GET /profiles/:userId/requests?cursor&limit`
 - Only for `role=buyer`; returns buyer's requests (safe fields) paginated.
- `GET /profiles/:userId/products?cursor&limit`
 - For `factory/buying_house`; returns products paginated; include video review flags.
- `GET /profiles/:userId/partner-network`
 - If viewer is same org or admin/owner: return connected factories list (id, name, verified).
 - Else: return only `{ total_connected: N }`.

Implementation notes:

- Use existing stores: `users.json`, `requirements.json`, `company_products.json`, `partner_requests.json`, `verification.json`.
- Reuse verification logic from `verificationService` to build the checklist + credibility summary (no new rules invented).

3) Smart notifications wiring (already mostly exists)

- Keep `POST /search/alerts` as the single endpoint (or migrate UI to `POST /notifications/search-alerts` and deprecate `/search/alerts`).
- Ensure newly created requirements/products already call `emitNotificationsForEntity` (they do) so saved alerts generate notifications.

Test Plan (manual acceptance)

1. `/search`
 - Basic search works; tabs switch; cards show author + verified badge.

- “Save alert” creates an alert and shows remaining quota; exceeding quota shows the correct message.
 - Premium-locked filters show upgrade prompt and do not apply to query when free.
2. Buyer profile `/buyer/:id`
- Loads dynamic user; verification checklist renders; contact opens `/chat`.
 - Buyer requests tab lists items; pagination works.
3. Factory profile `/factory/:id`
- Products tab lists items; video gallery shows only approved videos publicly.
4. Buying house `/buying-house/:id`
- Partner network shows count publicly; full list visible only when self/admin.
5. VerifiedOnly search filter
- Actually filters by the author’s verified status (not broken like current `r.verified` check).
-

Assumptions / Defaults

- Smart notifications on `/search` are **opt-in via “Save alert”** (not automatic for every query).
- Public verification display is **license-name checklist + ✓/missing + credibility score**; never show document IDs/numbers or uploaded files publicly.
- “Contact” always navigates to `/chat`; message-request vs inbox behavior stays enforced by existing backend logic (unverified → request pool).
