

Summary

Build a LinkedIn-style, blue/white, responsive combined feed that shows **Buyer Requests + Company Product Posts** together, with **icon-based filters**, a **"Unique" algorithm toggle** (to avoid feed-bubbles), and **working social actions** (comment/share/report) + **B2B CTAs** (Express Interest / Message) aligned with your buyer's workflow.

Key UX / UI behaviors (what the user sees)

1. Top control bar (primary controls)

- **Feed-type filter as icons** (no big text by default):
 - All (grid icon), Buyer Requests (briefcase/bag icon), Company Products (factory icon).
 - On click: show a **large header label** ("Buyer Requests" / "Company Products") and keep the icon highlighted.
- **Unique toggle** placed on the **top-right** of the feed area (not buried), with helper text: "Diversify feed".
- Optional: compact **category chips** (Shirts / Knitwear / Denim / Women / Kids) under the bar (1-tap filtering).

2. Role-based Quick Actions (non-inline posting)

- In the left column (desktop) or as a top "Quick actions" card (mobile):
 - Buyer: "Post a Buyer Request" → /buyer-requests
 - Factory/Buying House: "Post a Product" → /product-management
 - Buying House: "Go to Agent Dashboard" → /agent (optional shortcut)
- This matches your instruction to keep /feed clean and not overload users with forms.

3. Feed cards (two card types, consistent layout)

- **Buyer Request card**
 - Displays structured fields prominently: Category, Quantity, Timeline, Material, Certifications required, Shipping terms, Notes.
 - CTA:
 - Buying House/Admin: **Express Interest** (locks the request for that agent as per your workflow).
 - Others: **Message** (starts as request if sender is unverified).
- **Company Product card**
 - Displays: Product title, Category, Tags, MOQ/Lead time (if present), and media preview badge.
 - CTA: **Message** (same request vs inbox rule) + "View profile".

4. Verified badge visuals

- Use **blue tick** + **"Verified" text in distinct color** next to the name (high contrast).
- Tooltip or small detail line: "Verified (subscription)" (no pricing, no "buy permanently" wording).

5. Social actions

- Comment: opens a **modal/drawer** showing existing comments + add comment.
 - Share: copies a deep-link to the post + records the share.
 - Report: opens a modal to choose reason (preset + optional text), then enforces a short cooldown (already partly present).
-

Data + API behavior (what we implement/change)

1. Unify "Unique" state across app

- Remove the duplicate/conflicting Unique toggles (currently exists in navbar and feed).
- Single source of truth:
 - Persist in `localStorage` (per-user key) and apply it to /feed requests.
 - Default = **OFF** for first-time users (your selection), then "remember last state".

2. Feed endpoint enhancements (for real "modern" feel)

- Add pagination to GET /feed :
 - Query: `type=all|requests|products, unique=true|false, category=, cursor=, limit=`
 - Response: `{ items, next_cursor, metadata }`
- Update frontend to support **infinite scroll** (or "Load more" button as fallback).

3. Improve "Unique" algorithm (server-side)

- Replace the current "even-index/category contains" logic with deterministic diversification:
 - Avoid consecutive same author
 - Enforce category spread (e.g., max 2 in a row from same category)
 - Blend in exploration items (e.g., 20%) outside the user's dominant category
- Keep your existing boost rules (new profiles get reach) but ensure "Unique" doesn't destroy relevance.

4. Express Interest flow

- On success, show a confirmation banner and a button: "Open Chat".
 - If locked, show clear error + "Request access in chat" hint.
-

Implementation map (minimal file touch targets)

- Frontend: refactor and upgrade `C:\Users\tokyi\OneDrive\Desktop\meow\src\pages\MainFeed.jsx`
 - Split into components in-place or `src/components/feed/*` (Card, ControlBar, CommentModal, Skeleton).
 - Global unique toggle: wire/remove from `C:\Users\tokyi\OneDrive\Desktop\meow\src\components\NavBar.jsx` so it doesn't conflict.
 - Backend ranking/unique/pagination: update `C:\Users\tokyi\OneDrive\Desktop\meow\server\services\feedService.js` (+ controller to pass cursor/limit).
-

Test plan (manual acceptance)

1. `/feed` loads on mobile + desktop; layout collapses to 1 column on small screens.
 2. Icon filters switch between All/Requests/Products; large label appears after click.
 3. Unique toggle:
 - Changes feed order/content
 - Persists after refresh and after navigating away/back.
 4. Comment modal: create comment → appears immediately; refresh shows it persisted.
 5. Share: copies link + records action.
 6. Report: requires reason; cooldown prevents repeat spam.
 7. Express Interest:
 - First agent can claim
 - Second agent gets "locked" response and proper UI message.
-

Assumptions (locked for implementation)

- `/feed` will **not** include an inline "create post" form; it will provide **Quick Action** links to the existing pages.
- Unique default is **OFF** on first use, then persisted.
- Icons will use `lucide-react` (already installed) and follow a clean LinkedIn-like style (blue/white, minimal gray).
